

How to use BHRT MD pump

Your cream has been supplied to you in an MD (measured dose) BHRT pump container which is specifically designed to enable exact dosing for your product.

The pump device attached to the top of the container (known as actuator) delivers a specific quantity. The volume is generally 0.5mls per pump for NCC BHRT creams.

Important Points

- The product is a self-priming device which means it doesn't need any calibration before or after using the product.
- When the container is used for the first time you will need to press down on the top pump a couple of times, until you begin to see cream come through the nozzle. Once this occurs then your device is ready to accurately dose.
- Keep your eye on the clear window, this will be the best guide to how much cream is left.
- After pumping
 - Wipe the nozzle clean
 - Reapply the lid
 - Place in cool storage area (under 30 degrees) until next dose is due.

When you require another repeat or order of your BHRT product please contact NCC on **1300 731 755** or email admin@customcompounding.com.au

We recommend allowing 24 to 48 hours to have your compound made.
